

PROPOSAL FOR MEMO MANAGEMENT SYSTEM AT KOFORIDUA TECHNICAL UNIVERSITY

1. Introduction

Effective internal communication is essential for efficient administration and decision-making in universities. Traditional paper-based memo handling at educational institutions, including Koforidua Technical University (KTU), is slow, prone to loss, hard to track, and difficult to archive. These challenges can result in delays in administrative responses, miscommunication between departments, and a lack of accountability.

To address these problems, this project proposes the design and development of an electronic Memo Management System (MMS) that will modernize the creation, distribution, tracking, and archiving of official memos at KTU. The system will automate memo workflows, enhance communication transparency, and support secure memo distribution across departments.

2. Problem Statement

KTU's current internal communication relies heavily on printed memos circulated manually between offices and departments. This manual process leads to:

1. Delayed delivery of important notices and approvals.
2. Misplaced or lost memos, which disrupt workflow continuity.
3. Lack of tracking and auditing, making it hard to verify receipt or read status.
4. Inefficient record-keeping that complicates document retrieval and institutional memory.

These issues reduce operational effectiveness, increase administrative workload, and create bottlenecks in information flow.

3. Main Objective

The main objective of this project is to **design and implement an electronic Memo Management System** for Koforidua Technical University.

4. Specific Objectives

1. To design and develop a module that will ensure memos are distributed to targeted users, departments, or organizational units.
2. To design and develop a module to implement tracking and read-receipt functionality to monitor memo circulation.
3. To design and develop a module that notify user in memos tracking using SMS and email.

5. Scope of Study

The study will focus on the administrative units and departments within **Koforidua Technical University**. It will cover electronic memo handling from creation to receipt confirmation, storage, categorization, and retrieval. The system will not initially cover external stakeholder communication (e.g., external vendors or public notices) but may be expanded later.

6. Methodology

The project will adopt a **software development life cycle (SDLC)** approach, including:

Requirement Analysis

Gathering requirements from university administrators, department heads, and registry staff to identify workflow needs.

System Design

Developing system models using flowcharts, database schema, and user interface prototypes.

Implementation

Building the system using modern web technologies and backend services that support authentication, memo storage, and notification.

Testing

Conducting unit testing, integration testing, and user acceptance testing to ensure usability and security.

Deployment and Evaluation

Deploying the system for pilot use at KTU and evaluating its impact on memo workflow efficiency.

8. Conclusion

The proposed Memo Management System will transform internal communication at Koforidua Technical University by replacing manual memo workflows with an integrated electronic platform. This will increase efficiency, accountability, and transparency, reduce delays, and provide a reliable record-keeping mechanism. With the successful implementation of this system, KTU will enhance its administrative operations and serve as a model for other institutions seeking digital transformation.
